

Next-JS, React - Interview Assignment

Duration: 3 hours

- Please complete the following UI challenge and deploy to free PaaS. (Ex. Heroku, Vercel). As in the UI, when a user sends the message it should save in redux state and should show newly added messages in UI real time. Use random images for user profile images. Form validation is mandatory (Use react-hook-forms). You can use <https://randomuser.me/> for random user image generation
- Use ReactJS or NextJS (preferred) , and tailwind as CSS Library (must).
- Use react functional components. (Don't use class component.)
- Use Redux as State Management (must).
 1. User should be able to reply to the added messages and the replies should be properly indented under the message.
 2. Users should be able to upvote and downvote the comments.
- Please send the url of the deployed web application and code base as zip file as reply to the email.
- UI is provided below and also send as attachment in via email.

Impressive! Though it seems the drag feature could be improved. But overall it looks incredible. You've nailed the design and the responsiveness at various breakpoints works really well.

Woah, your project looks awesome! How long have you been coding for? I'm still new, but think I want to dive into React as well soon. Perhaps you can give me an insight on where I can learn React? Thanks!

@maxblagun If you're still new, I'd recommend focusing on the fundamentals of HTML, CSS, and JS before considering React. It's very tempting to jump ahead but lay a solid foundation first.

@ramsesmiron I couldn't agree more with this. Everything moves so fast and it always seems like everyone knows the newest library/framework. But the fundamentals are what stay constant.
